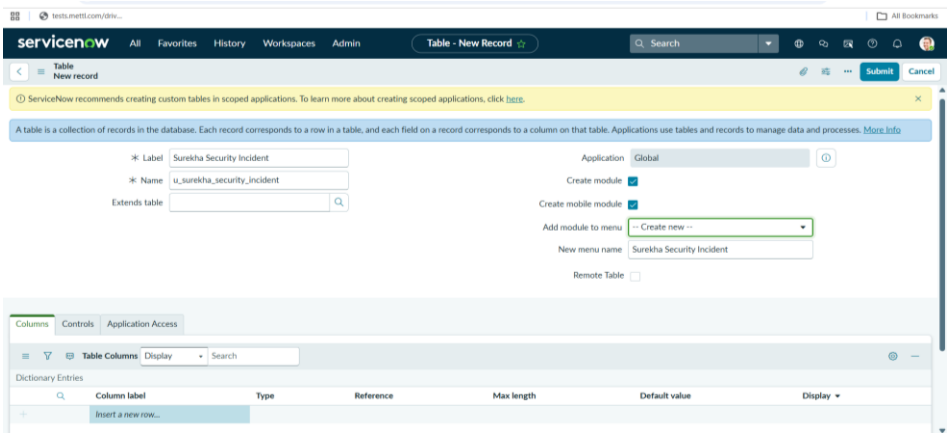
SERVICENOW SECURITY INCIDENT AUTOMATION

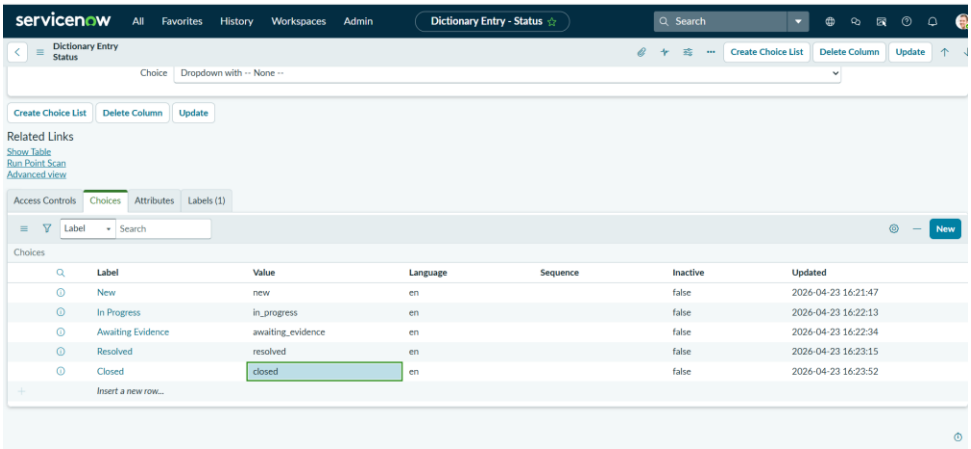
By Surekha Desam

Creating Table

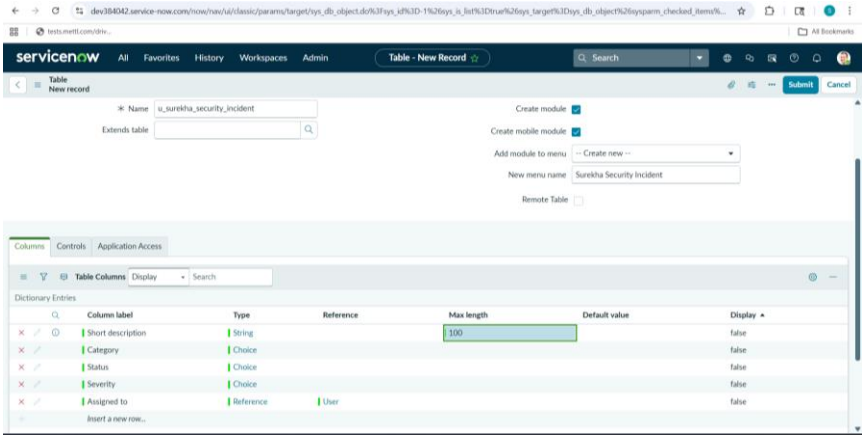
Here I was created a new table and going to add few columns which help to categories the incidents.

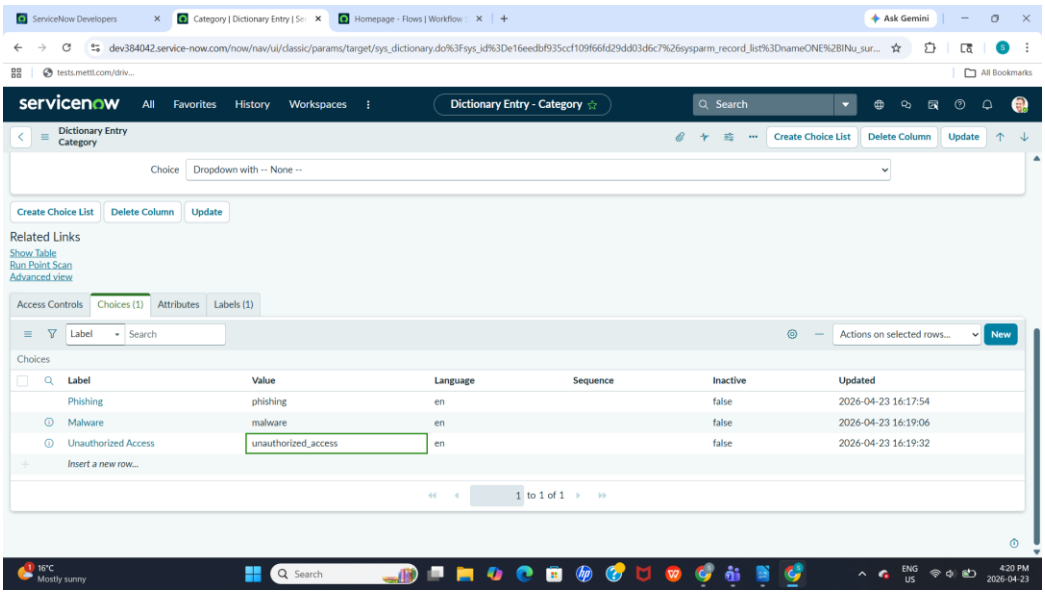


I added few columns like Short description ,categeory, Status, Severity, Assigned to

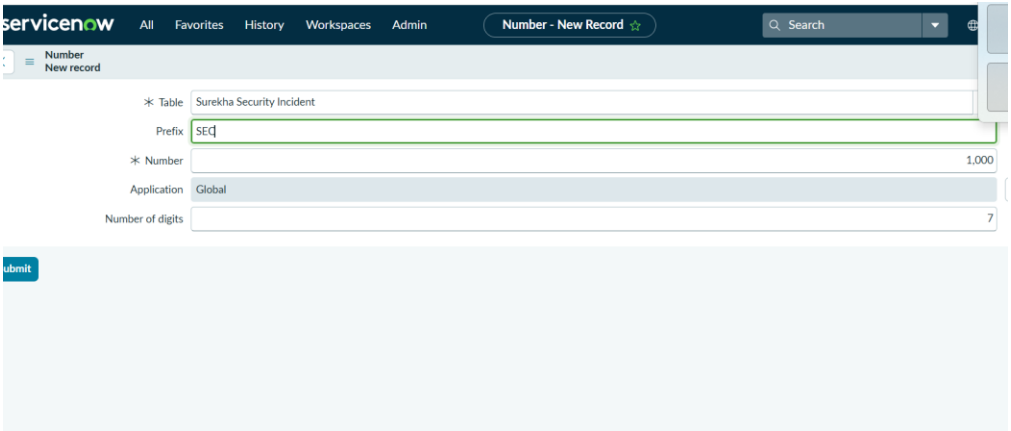


Here i added few choices inside each and every columns





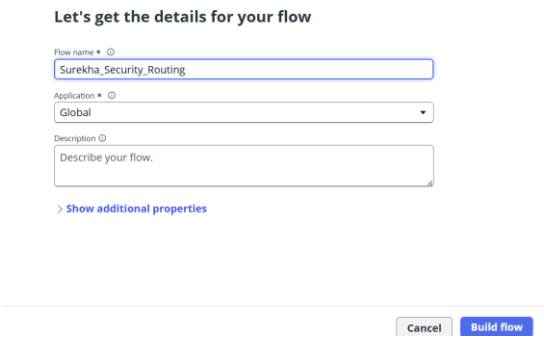
By default, your records don't have IDs. Let’s add the "SEC" prefix.Now, every time you create a record, ServiceNow will automatically label it SEC0001001, SEC0001002, etc.



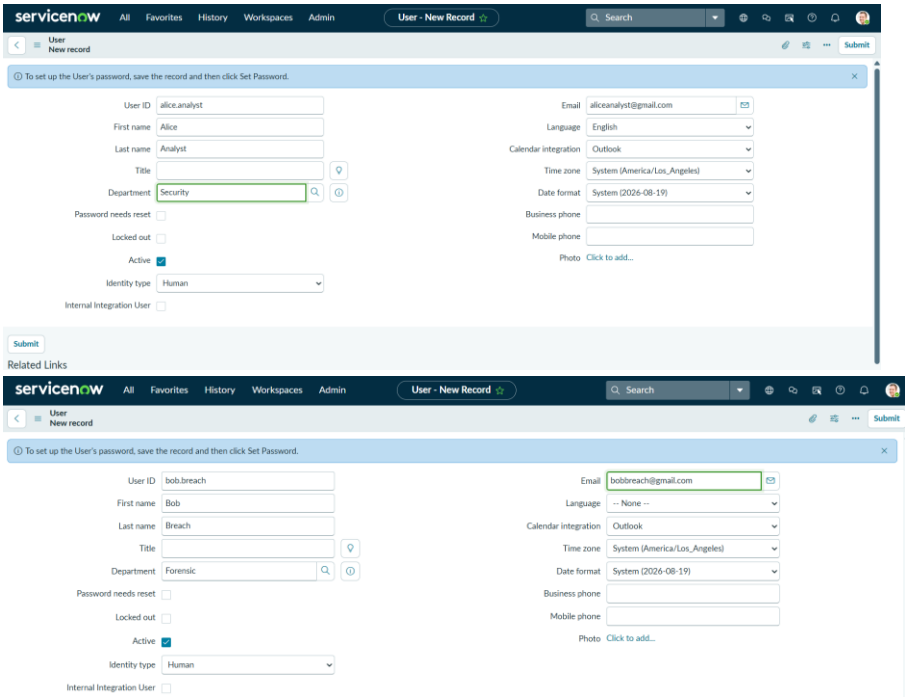
Intelligent Routing (The "Brain"): I designed the automation logic using **ServiceNow Flow Designer**. The flow triggers automatically upon record creation. It features a multi-branch conditional structure:

- **If Phishing:** Auto-assigns to Alice Analyst.
- **If Malware:** Auto-assigns to Bob Breach.
- **If Unauthorized Access:** Auto-assigns to the Security Admin. This ensures zero 'dwell time' between a report being filed and an analyst being notified."

I created the new flow by giving the name as the Security_Security_routing



I created the 2 users Alice and Bob



I built if loop flow logic to segregate my malware, phishing, unauthorized access categories.

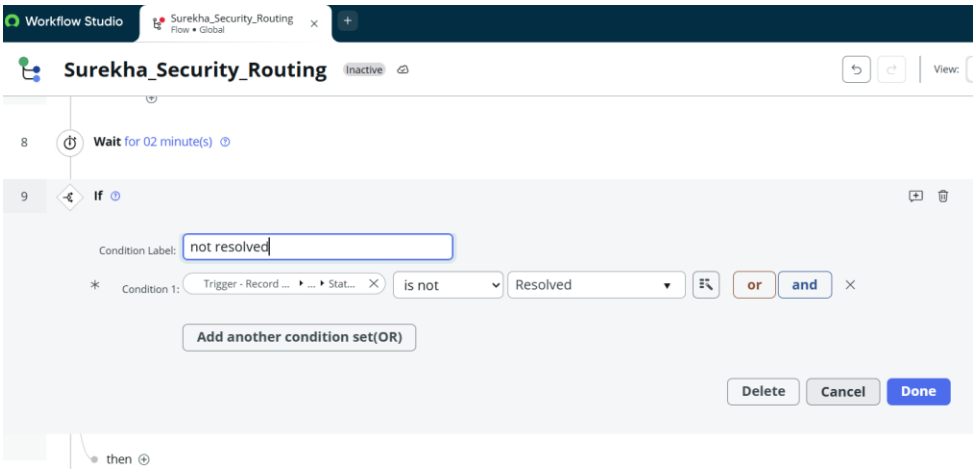
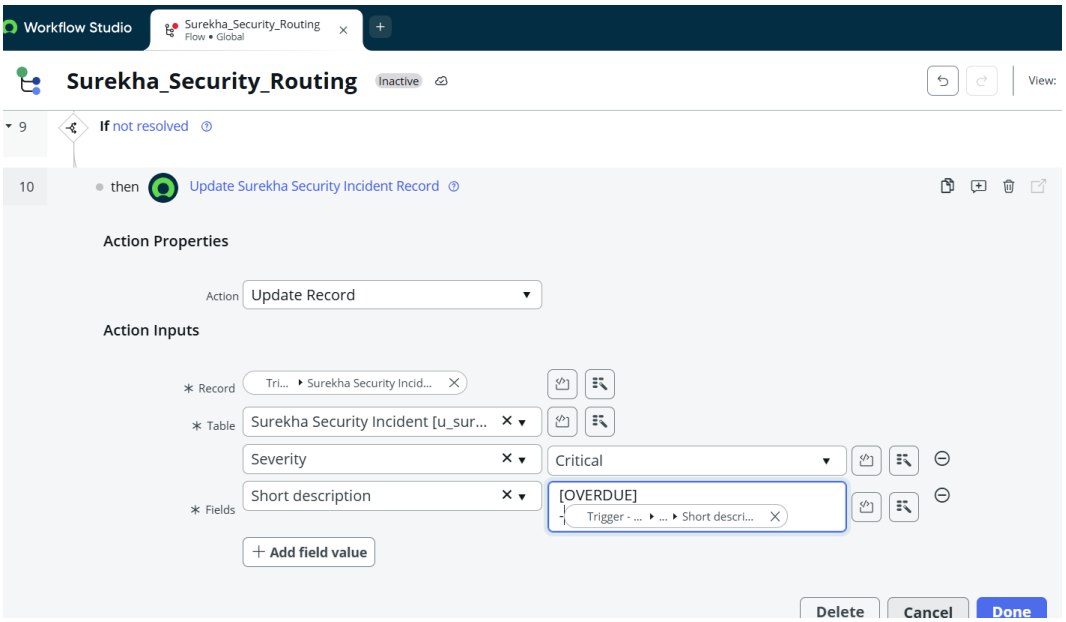
I added the wait time here if we dont resolve the incident after 2 min it goes under escalate mode





I also added email section for every loop so that person can notify immediately

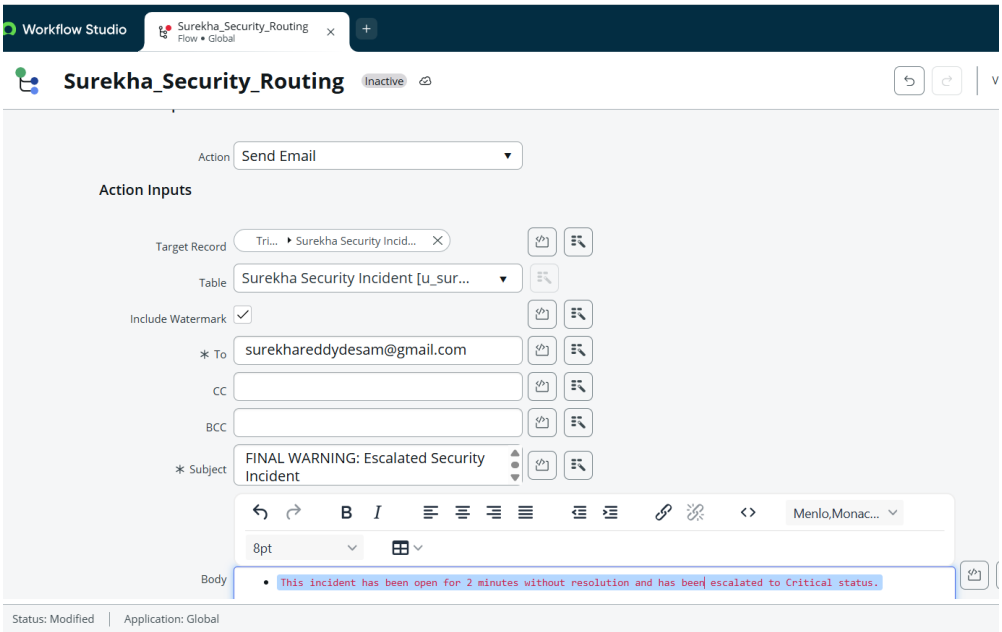
Body



This is my final flow design,

1. **The Trigger and Initial Response:** The process starts the instant a new record is created in your custom security table. The first thing the flow does is an Update Record action to set the status to "In Progress." This ensures that as soon as a ticket exists, the system marks it as being actively handled.

2. **Intelligent Triage (Branching Logic):** The flow then uses "If" and "Else If" statements to read the Category field and decide who the best expert is for the job:

- Phishing Branch: If the category matches "Phishing," the logic updates the record to assign it to Alice Analyst and sends her an email.
- Malware Branch: If it's "Malware," the logic shifts and assigns the record to Bob Breach with a corresponding notification.
- Unauthorized Access Branch: If it matches this category, it routes the ticket to the Surekha Admin.

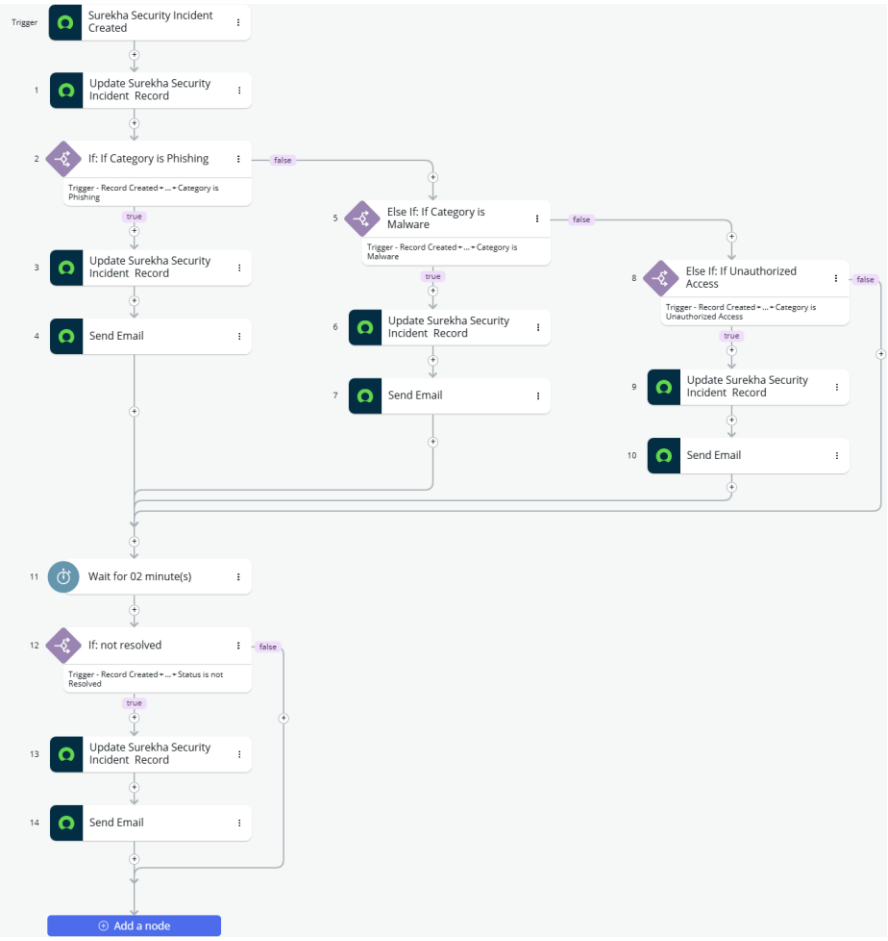
3. The SLA Watchdog (Time-Based Logic)

Once the ticket is assigned, the flow enters a "Wait" state for 2 minutes. This acts as your Service Level Agreement (SLA). It gives the analyst a window of time to investigate and move the ticket to a "Resolved" status.

4. Escalation Logic (The Safety Net)

After the 2 minutes are up, the flow performs a final check: "Is the status NOT Resolved?"

- If it is Resolved: The flow sees the work is done and simply ends.
- If it is NOT Resolved: The logic triggers an escalation. It automatically changes the Severity to Critical and renames the ticket by adding "[OVERDUE]" to the description. This ensures that neglected incidents get immediate management attention.



Here i starting created new incidents to see my flow works or not , At the starting when i add the incident it doesn't assign to anyone later when the flow activated it automatically assigns to alice analyst and automatically the status changes to in progress and after 2 min it was escalated same happens for all
